TRUSTRIDE

Domain model

What the system stores, and the path from a rider signing up to a driver being paid. Task F1. 3 October 2026.

1. What you decided today

Question	Decision
What a subscription covers	Configurable per plan. A plan covers one trip a day or two. The three launch plans cover one.
What a rider gives us	Name, phone, stop, route and time. Nothing more for now.
No-shows	Configurable per plan. Launch default: she gets the day back only if she told us in time.
SMS	Skipped for now. Login codes go to the log file.

> **What configurable direction costs.** A rider's seat can't be a column on her subscription any more, because she may hold two. So seats are their own table, and the operator may have to pick two runs when approving her. That's one extra table and a slightly longer approval screen. I've built it that way.

Two things I chose because nothing was decided. Change either with one setting.

- **In time means 12 hours before departure.** For a 7am van, she must tell us by 7pm the evening before.
- **A seat is kept for 3 days after a subscription ends.** If she hasn't renewed by then, the seat is free for someone else.

2. The words

Word	Meaning
Stop	A named place where riders wait. Created once.
Route	An ordered list of stops, ending at the destination.
Run	One driver, one vehicle, one route, one direction, one departure time, on set days of the week. It says how many seats the driver holds for us.
Seat	One rider's place on one run, at one stop. Reserved when she's approved, active when she pays.
Plan	What we sell: a length in days, a price, trips a day, and the no-show rule.
Subscription	One rider's purchase of one plan, with a start and an end date.
Notice	A rider telling us she won't ride on a given day.
Statement	One driver's month: his commission, his assessment, and whether he's been paid.

3. What each module stores

Network

Table	Holds
stops	Name, landmark, area, map position (optional), active or not
routes	Name, where it starts, the destination, active or not, organisation
route_stops	Which stops a route has, their order, and minutes from the first stop

Drivers

Table	Holds
drivers	Name, phone, licence number and expiry, Ghana Card number, next of kin, monthly commission, status, organisation. Linked to his mobile account.
mates	Name, phone, which driver he works with. Linked to his mobile account.
vehicles	Registration, make, colour, total seats, status, which driver, organisation
vetting_items	The checklist. Each item is for a driver or a vehicle, and is required or not. Editable.
vetting_checks	One item's result for one driver or vehicle: passed or failed, notes, who checked. If overridden: who and why.
driver_statements	One row per driver per month: commission, bonus, assessment result and notes, who assessed, when paid, by whom, payment reference

Riders

Table	Holds
riders	Name and status. Linked to her mobile account.
rider_applications	Route, pickup stop, morning time, evening time, status. If rejected: the reason. Who reviewed it and when.

Subscriptions

Table	Holds
plans	Name, days, price, trips a day, no-show rule, notice cut-off, active or not
runs	Route, driver, vehicle, direction, departure time, days of the week, seats held, organisation
seats	Rider, run, pickup stop, status, the application it came from
subscriptions	Rider, plan, status, start and end dates, days credited, who activated it. The price and rules are copied from the plan at purchase, so changing a plan never changes what someone already bought.
absence_notices	Rider, date, when she told us, whether it was in time, whether the day was credited

Money is stored in pesewas as whole numbers. GHS 60 is 6000. Trips, Support and Payments get their tables in later phases.

4. Statuses

Thing	Statuses
Application	pending, approved, rejected, withdrawn
Rider	applicant, approved, inactive
Driver	pending, approved, suspended
Vehicle	pending, approved, off the road
Seat	reserved, active, released
Subscription	active, expired, cancelled

A rejection reason is one of: no seats left, route not served, time not served, other. It's about what we can serve, not about her.

5. The path, from signup to payday

Setting up, done by operators

1. Add stops, then a route that lists them in order.
2. Add a driver, his vehicle and his mate. Each gets a mobile account with the right role.
3. Work through the vetting checklist. A failed item can be overridden, and the override records who and why.
4. Approve the driver. The system refuses until every required item is passed or overridden.
5. Create his run: route, direction, time, days, and how many seats he holds for TrustRide.

A rider joins

1. She logs in with her phone number. She's a rider from that moment.
2. She applies: route, pickup stop, the time she wants.
3. An operator reviews it. To approve, he picks the run that will carry her. That reserves a seat. If the run is full, the system refuses.
4. Or he rejects it with a reason.
5. She chooses a plan and pays. Until Hubtel is wired in, an operator activates the subscription by hand. Both will run the same code.
6. Her seat becomes active. She sees the car number, colour, driver, stop and time.

Day to day

1. Operators open Today's riders and see each run with its riders in stop order.
2. If she tells us in time that she won't ride, her subscription gets a day longer. Late notice, or none, gets nothing.
3. A daily job expires subscriptions that have ended. Three days later, if she hasn't renewed, her seat is released.
4. Renewing starts the new subscription the day after the old one ends, so she never loses days.

Month end

1. An operator opens the driver's statement for the month. The commission comes from his record.
2. He records the assessment and any bonus.
3. He pays the driver outside the system, then marks the statement paid with the reference.

> **This is not fare money.** The statement records what TrustRide owes a driver for holding seats. Fares still go from the rider to the mate, and never touch the system.

6. Still open

Open question	What the system does until it's answered
The driver's monthly commission	A number on each driver's record. Nothing is assumed.
What the assessment measures	A result (met or not met) and free notes. No scoring.
Which route is the pilot	None is seeded. You add it in the console.
Was dropping the one-week plan deliberate	Three plans are seeded. Adding a fourth is a row.
Days before a rider counts as gone	No automatic deletion yet. That's task H1.
